

Hello CPPBuddies

Day 04

Welcome

To

C++ COMPLETE BOOTCAMP

Your Guide To A Solid Foundataion in C++

Let us begin

LECTURE 04
DAY 04 WEEK 01

C++ PROGRAMMING GETTING STARTED WITH BASICS OF C++

WELCOME EVERYONE

C++ Complete Bootcamp

YOUR GUIDE TO PROGRAMMING

In association with
Inspire Club, MANIT BHOPAL

C++ is an extension to C

What does this mean?

**Everything we can use in C,
can also be used in C++**

C++ is superior to C

Using `printf()` and `scanf()` in `C++` YES WE CAN USE

Why and when to use this?

When we want formatted
input and output in a simple
and elegant way

What is format specifier?

commonly used format specifier

Format Specifier	Description
%d	Integer Format Specifier
%f	Float Format Specifier
%c	Character Format Specifier
%s	String Format Specifier
%u	Unsigned Integer Format Specifier
%ld	Long Int Format Specifier

Format specifiers can be defined as the operators which are used in association with `printf()` function for printing the data

DEMO

Formatting Input & Output

scanf()

printf()

Do `printf()` and `scanf()` return anything ?

YES

Why ?

Since, they are `functions`, and we know functions have `return values`

What values do the **printf()** and **scanf()** functions return ?

printf() : It returns **total number of characters printed**, or negative value if an output error or an encoding error

scanf() : It returns **total number of inputs scanned successfully**, or EOF if input failure occurs before the first receiving argument was assigned.

C++ Formatting MANIPULATORS

```
#include <iomanip>
```

Stream Manipulators are functions specifically designed to be used in conjunction with the `insertion (<<)` and `extraction (>>)` operators on `stream objects`

SOME **COMMON MANIPULATORS**

`endl`

This manipulator has the same functionality as '\n'

`setw()`

This manipulator changes the width of the next input/output field.

`setprecision()`

This manipulator changes floating-point precision.

`boolalpha`

This displays boolean literal value

`setbase()`

This sets the base of the next input field

`showpoint/noshowpoint`

This manipulator controls whether decimal point is always included in the floating-point representation.

DEMO

Manipulators

Operators Precedence

Category	Operator	Associativity
Postfix	() [] -> . ++ --	Left to right
Unary	+ - ! ~ ++ -- (type)* & sizeof	Right to left
Multiplicative	* / %	Left to right
Additive	+ -	Left to right
Shift	<< >>	Left to right
Relational	< <= > >=	Left to right
Equality	== !=	Left to right
Bitwise AND	&	Left to right
Bitwise XOR	^	Left to right
Bitwise OR		Left to right
Logical AND	&&	Left to right
Logical OR		Left to right
Conditional	?:	Right to left
Assignment	= += -= *= /= %= >>= <<= &= ^= =	Right to left
Comma	,	Left to right

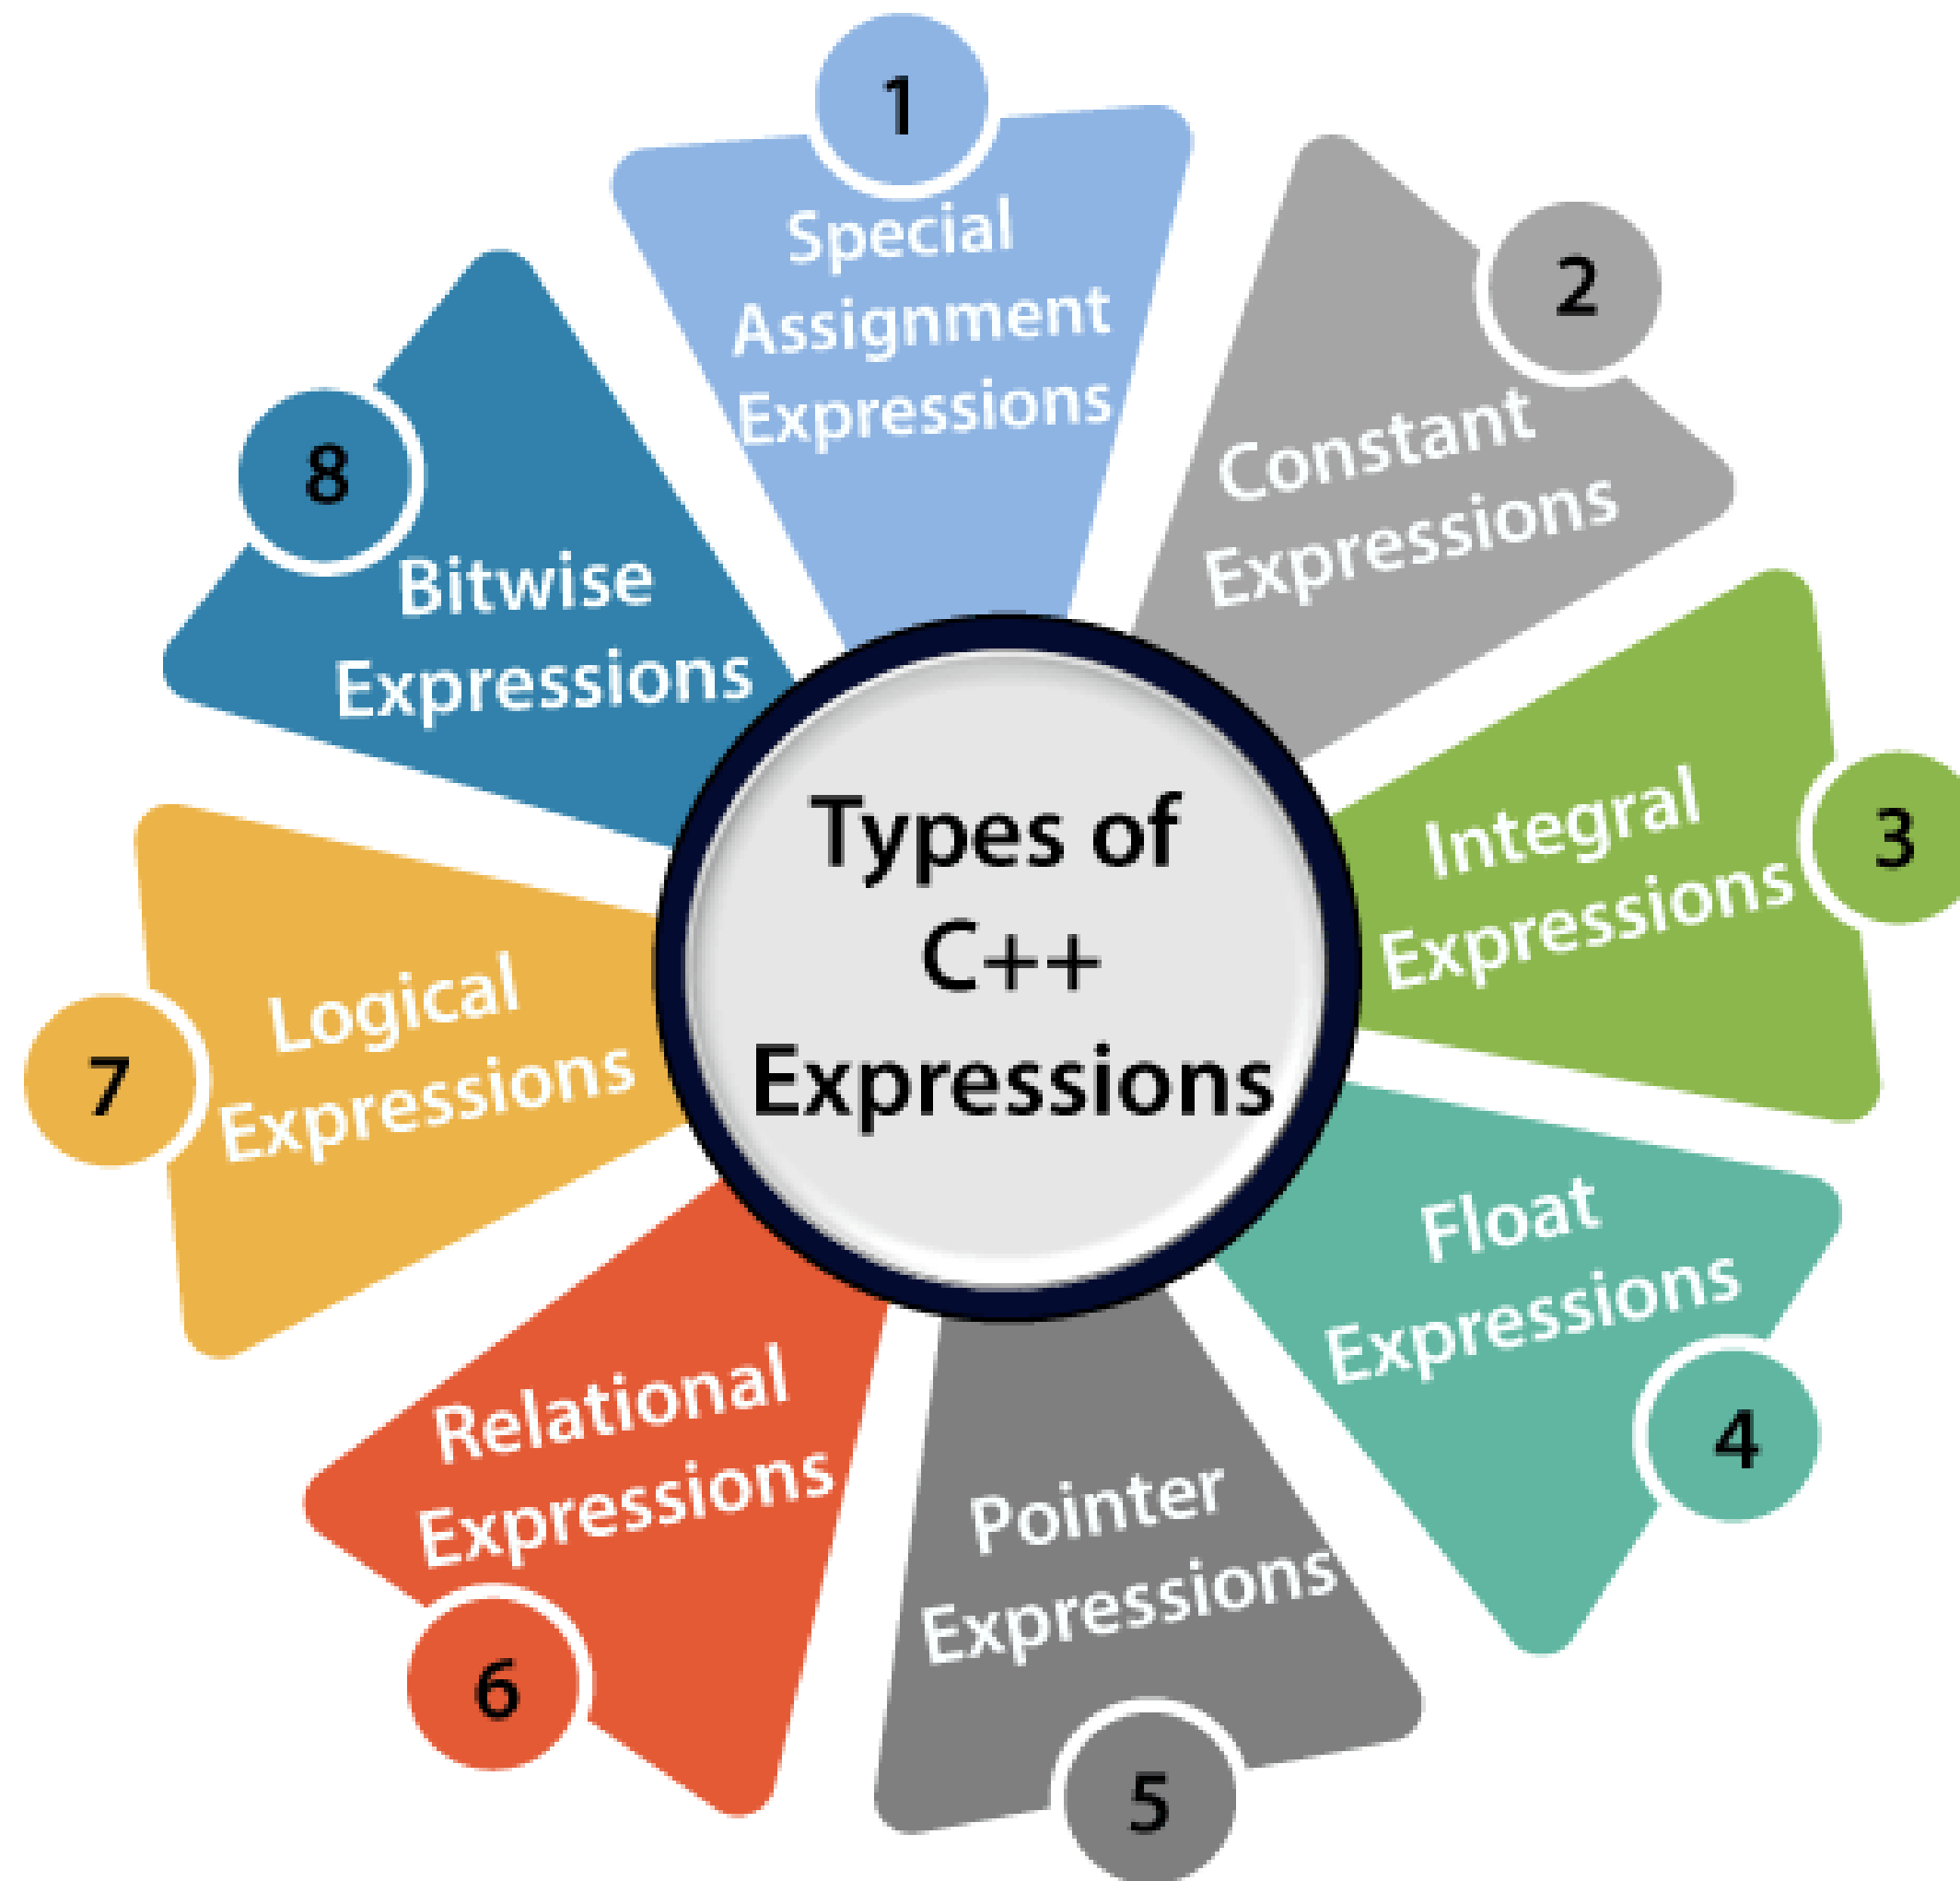

C++

MORE ON EXPRESSIONS

A combination of variables, constants and operators that **represents a computation** forms an expression

Expression evaluation may produce a result (e.g., evaluation of **2+2** produces the result **4**) and it may generate side-effects (e.g. evaluation of **printf("%d",4)** prints the character '4' on the standard output).

Types of Expressions

THANK YOU

keep calm,
wear mask,
and
study hard
